## 1 Overview

The Flash Partner API provides access to Flash's products and services. We offer integrations for both Direct Merchants and Payment Service Providers. If you have any questions or queries, please feel free to contact us at [integrations@flash.co.za](mailto:integrations@flash.co.za)

### 1.1 Authentication

All requests are protected by API bearer authentication using OAuth 2.0 access tokens. An access token is issued by the OAuth 2.0 server from the Access Token URL and is valid for 3600 seconds (60 minutes):

(.).

Environment	Token URL
Staging	<a href="https://api-flashswitch-sandbox.flash-group.com/token">https://api-flashswitch-sandbox.flash-group.com/token</a>
Production	<a href="https://api.flashswitch.flash-group.com/token">https://api.flashswitch.flash-group.com/token</a>

#### 1.1.1 Generating an Access Token

Flash Integrations will have provided your organisation with an API Key for both Sandbox and/or Production. To obtain an access token, run the following command (where Authorization: Basic is followed by the API Key provided by Flash Integrations) and the response will include the access token as well as the token's validity period in seconds.

Request Example	Response Example
<pre>curl -k -d "grant_type=client_credentials" -H "Authorization: Basic X0ZlODIDbllpeEVUbHBfdDJsWHdhOIN3SmY5dGd3STlx0w4VmxBcGMwTWE" https://api.flashswitch.flash-group.com/token</pre>	<pre>{   "access_token": "13035646-274b-30d9-b666-706c8f4dbab4",   "scope": "am_application_scope default",   "token_type": "Bearer",   "expires_in": 3600 }</pre>

When testing in a Sandbox environment, make sure to use your Sandbox token. Once you're ready to send live transactions, you can switch to the Production token. If authorization errors occur due to an expired token or you feel your token may have been compromised, please generate a new token.

#### 1.1.2 Authenticating an API call

To send API requests through the Flash Partner API, the access token must be included with every API call. To authenticate an API request, the following parameters must be sent.

### 1.1.2.1 Request Parameters

Parameter	Value
Location	Endpoint
Accept	application/json
Content-Type	application/json
Authorization	Bearer <a href="#">Access Token</a>
Data	<a href="#">Request</a>

### 1.1.2.2 Example Request and Response

Request Example	Response Example
<pre>curl --location 'https://api.flashswitch.flash-group.com/aggregation/4.0/1voucher/purchase' \ --header 'Content-Type: application/json' \ --header 'Accept: application/json' \ --header 'Authorization: Bearer 1009c9b5-c70f-3ca4-8429-bd568fbc7597' \ --data '{<a href="#">Request</a>}'</pre>	<a href="#">Response</a>

## 1.2 Error Handling

### 1.2.1 Response Codes

#### 1.2.1.1 Successful Response

The API should return an HTTP status code 200 for all successful requests. The response body should be a JSON object containing a key `responseCode` with a value of 0. This indicates a successful operation. Additional data relevant to the request may be included in the response JSON object. Examples of successful responses can be found [here](#).

PLEASE NOTE: JSON is a loosely structured protocol; whilst it is Flash's intention to conform as strictly as possible to the API data specifications as written, certain extra fields might be present in API response payloads that are not documented. Please configure your parser to be permissive when dealing with responses, and simply ignore any values that do not match the documented API structures.

#### 1.2.1.2 Unsuccessful Response

If an API call is unsuccessful, it should still return an appropriate HTTP status code (non-200) to indicate the failure. The response JSON object should contain an error code and a descriptive error message to help identify the issue.

In some cases, an API call may result in an unsuccessful response (`responseCode` is not 0) despite an HTTP status code 200. This can occur due to errors from intermediary systems.

Example of an unsuccessful response:

Response Example
<pre>{   "error": {     "code": 401,     "message": "Unauthorized"   } }</pre>

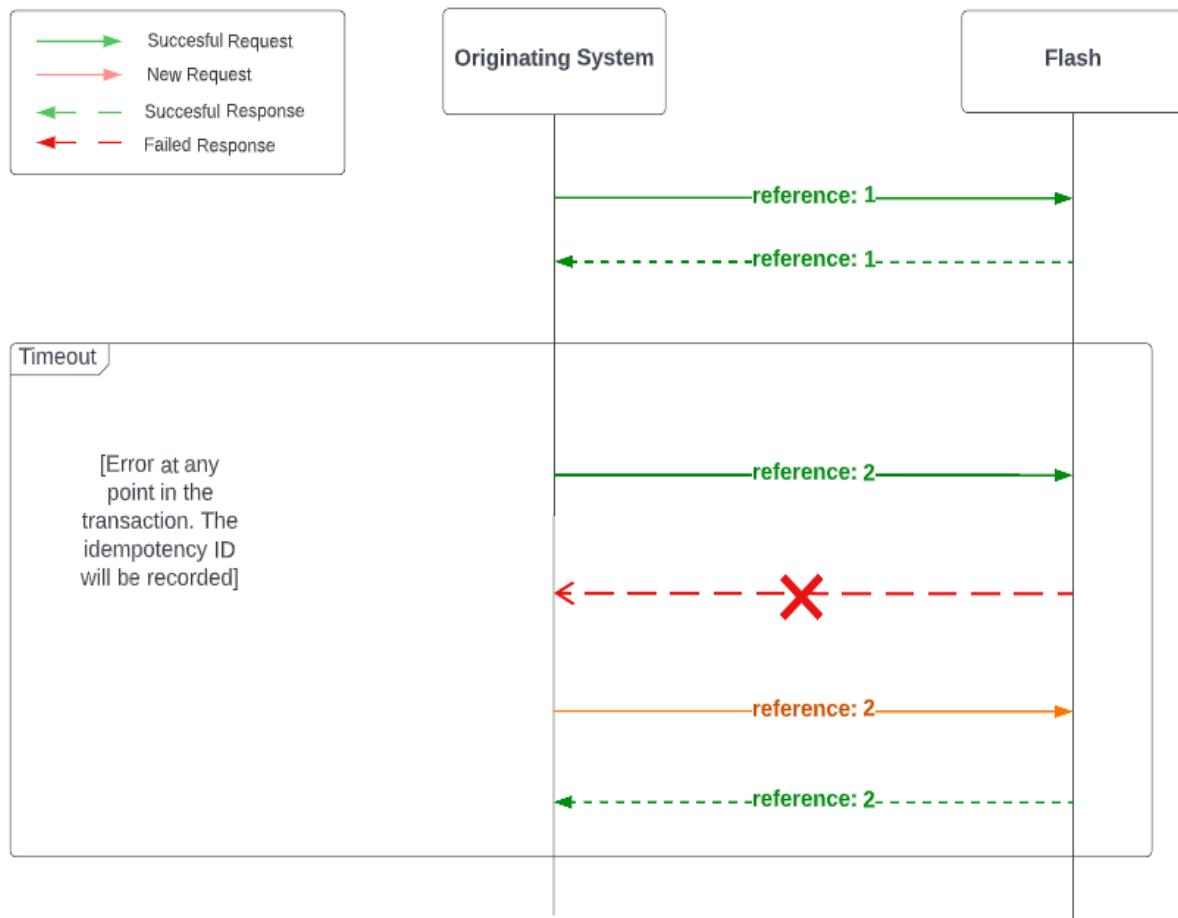

```
{
  "responseCode": 2402,
  "responseMessage": "The voucher you have entered could not be found",
  "reference": "Integrations_test",
  "transactionId": "257901",
  "path": "/api/v4/1voucher/redeem"
}
```

For a comprehensive list of possible error codes and their corresponding descriptions, please refer to [Response Codes](#).

It is essential to handle both successful and unsuccessful responses appropriately in your application to ensure robust error handling and user experience.

### 1.2.2 Idempotent Requests

The endpoints in this API are designed with idempotency, which means that if a subsequent request is sent with the same **reference** as the initial request, it will return the response of the initial request. This is particularly useful in cases of a broken connection or timeout during the response process. To make use of the idempotency, subsequent requests or retries must include the same **reference**. The figure below shows an example of the flow of an idempotent request.

### 1.2.3 Reversals

Reversals are available on supported products where applicable. The reversal endpoint allows the complete reversal of a transaction to its original state. This functionality is particularly useful for Point of Sale (POS) applications, especially in cases where there is a broken connection or timeout during the response process.

When a reversal is successfully issued on a product, a new transaction is not recorded in the transaction file and all charges related to the original transaction are reversed, setting the original transaction's status to 'Reversed.'

Reversals can be performed only on the following Products: [1Voucher](#), [Cash Out PIN](#), [Eezi Voucher](#). Where reversals are not supported for a product, a specific error message will be returned.

## 2 API Reference

### 2.1 Base URL

The base URLs for this API are as follows:

Environment	Base URL
Sandbox	<a href="https://api-flashswitch-sandbox.flash-group.com">https://api-flashswitch-sandbox.flash-group.com</a>
Production	<a href="https://api.flashswitch.flash-group.com">https://api.flashswitch.flash-group.com</a>

### 2.2 Accounts

The Accounts resource group provides non-product specific queries and actions relating an account. The following endpoints are available for Accounts:

#### 2.2.1 List Products

HTTP Method	Endpoint
GET	<a href="#">Base URL</a> /aggregation/4.0/accounts/{accountNumber}/products

##### 2.2.1.1 Example Request and Response

For a request and response example, please refer to the [List Products](#) request and response.

#### 2.2.2 Lookup a Product by Product Code

HTTP Method	Endpoint
GET	<a href="#">Base URL</a> /aggregation/4.0/accounts/{accountNumber}/products/{productCode}

##### 2.2.2.1 Example Request and Response

For a request and response example, please refer to the Lookup a [Product by Product Code](#) request and response

#### 2.2.3 Lookup Products by Product Group

This applies to the following product groups: 1Voucher, Cash Out PIN, Cellular, Eezi Vouchers, Flash Token, Gift Vouchers, Prepaid Utilities and Flash Pay.

HTTP Method	Endpoint
GET	<a href="#">Base URL</a> /aggregation/4.0/accounts/{accountNumber}/products/{productGroup}

### 2.2.3.1 Example Request and Response

For a request and response example, please refer to the [Lookup Products by Product Group](#) request and response

## 2.3 1Voucher

The 1Voucher product group provides the ability to access 1Voucher services, this includes purchasing, disbursing, redeeming and refunding a redemption of a 1Voucher. The following endpoints are available for 1Voucher:

### 2.3.1 Purchase a 1Voucher

Note: this request will only be available for purchasing a 1Voucher using payment methods.

HTTP Method	Endpoint
POST	<a href="#">Base URL</a> /aggregation/4.0/1voucher/purchase

#### 2.3.1.1 Request Parameters

Parameter	Data Type	Required	Format	Description
reference	String	Yes	Only -,.= and alphanumeric characters allowed	<b>Client-defined reference number</b> Must be unique for all transactions.
accountNumber	String	Yes	Alphanumeric characters allowed	The <b>account number</b> of the Merchant.
amount	Integer	Yes	Cents	The <b>value of the 1Voucher being purchased</b> . The currency is "ZAR" and the value is in cents.
storeId	String	No	Alphanumeric characters allowed	The <b>store where the 1Voucher was purchased</b> . For Merchants with <b>Digital</b> channels, this will be a single value. For Merchants with <b>Physical</b> Store locations, each individual storeID will need to be sent in the request.
terminalId	String	No	Alphanumeric characters allowed	The <b>till in the store where the 1Voucher was purchased</b> . For Merchants with <b>Digital</b> channels, this will be a single value. For Merchants with <b>Physical</b> store locations, each individual terminalId will need to be sent in the request.
paymentMethod	String	No	Alphanumeric characters allowed	<b>The paymentMethod used to make the 1Voucher purchase</b> .
metadata	Set of Key Value Pairs	No	Up to 9 properties. Property name up to 10 characters. Property value up to 43 characters	<b>Set of key-value pairs</b> . This can be useful for storing additional information about the transaction in a structured format. e.g. key-value pair: storeID and value could be used to identify Voucher redemptions at a store level.

### 2.3.1.2 Example Request and Response

For a request and response example, please refer to the [Purchase a 1Voucher](#) request and response.

### 2.3.2 Disburse a 1Voucher

Note: this request will only be available for disbursing 1Vouchers from an online balance.

HTTP Method	Endpoint
POST	<a href="#">Base URL</a> /aggregation/4.0/1voucher/disburse

#### 2.3.2.1 Request Parameters

Parameter	Data Type	Required	Format	Description
reference	String	Yes	Only -.,= and <b>alphanumeric characters</b> allowed	<b>Client-defined reference number</b> Must be unique for all transactions.
accountNumber	String	Yes	<b>Alphanumeric characters</b> allowed	The <b>account number</b> of the Merchant.
amount	Integer	Yes	<b>Cents</b>	<b>The value of the 1Voucher being disbursed.</b> The currency is "ZAR" and the value is in cents.
storeId	String	No	<b>Alphanumeric characters</b> allowed	<b>The store where the 1Voucher was disbursed.</b> For Merchants with <b>Digital</b> channels, this will be a single value. For Merchants with <b>Physical</b> Store locations, each individual storeID will need to be sent in the request.
terminalId	String	No	<b>Alphanumeric characters</b> allowed	<b>The till in the store where the 1Voucher was disbursed.</b> For Merchants with <b>Digital</b> channels, this will be a single value. For Merchants with <b>Physical</b> store locations, each individual terminalID will need to be sent in the request.
metadata	Set of Key Value Pairs	No	<b>Up to 9 properties.</b> Property name up to 10 characters. Property value up to 43 characters	<b>Set of key-value pairs.</b> This can be useful for storing additional information about the transaction in a structured format. e.g. key-value pair: storeID and value could be used to identify Voucher redemptions at a store level.

#### 2.3.2.2 Example Request and Response

For a request and response example, please refer to the [Disburse a 1Voucher](#) request and response.

### 2.3.3 Redeem a 1Voucher

HTTP Method	Endpoint
POST	<a href="#">Base URL</a> /aggregation/4.0/1voucher/redeem

#### 2.3.3.1 Request Parameters

Parameter	Data Type	Required	Format	Description
reference	String	Yes	Only -,.,= and alphanumeric characters allowed	<b>Client-defined reference number</b> Must be unique for all transactions.
accountNumber	String	Yes	Alphanumeric characters allowed	The <b>account number</b> of the Merchant.
pin	String	Yes	16 digits	The <b>pin of the voucher</b> to be redeemed
amount	Integer	Yes	Cents	<b>The value of the 1Voucher being redeemed.</b> The currency is "ZAR" and the value is in cents. "0" value will redeem the full value of the voucher.
storeId	String	No	Alphanumeric characters allowed	<b>The store where the 1Voucher was redeemed.</b> For Merchants with <b>Digital</b> channels, this will be a single value. For Merchants with <b>Physical</b> Store locations, each individual storeId will need to be sent in the request.
terminalId	String	No	Alphanumeric characters allowed	<b>The till in the store where the 1Voucher was redeemed.</b> For Merchants with <b>Digital</b> channels, this will be a single value. For Merchants with <b>Physical</b> store locations, each individual terminalId will need to be sent in the request.
mobileNumber	String	No	11 Digits (27 Country Code with no leading 0)	For a <b>Partial Redemption/Change Voucher</b> where the redeemed amount is less than the Voucher value, the new Voucher will be sent as an SMS to the mobileNumber provided. If no mobileNumber is supplied, the Voucher will be returned in the response.
metadata	Set of Key Value Pairs	No	Up to 9 properties. Property name up to 10 characters. Property value up to 43 characters	<b>Set of key-value pairs.</b> This can be useful for storing additional information about the transaction in a structured format. e.g. key-value pair: storeID and value could be used to identify Voucher redemptions at a store level.

### 2.3.3.2 Example Request and Response

For a request and response example, please refer to the [Redeem a 1Voucher](#) request and response.

### 2.3.4 Refund a 1Voucher Redemption

Note: This request does not reference the original redemption transaction. Instead, a new voucher is provided for the full requested amount and the amount will be deducted from the redemption balance.

HTTP Method	Endpoint
POST	<a href="#">Base URL</a> /aggregation/4.0/1voucher/refund

#### 2.3.4.1 Request Parameters

Parameter	Data Type	Required	Format	Description
reference	String	Yes	Only -.,= and <b>alphanumeric characters</b> allowed	<b>Client-defined reference number</b> Must be unique for all transactions.
accountNumber	String	Yes	<b>Alphanumeric characters</b> allowed	The <b>account number</b> of the Merchant.
amount	Integer	Yes	<b>Cents</b>	<b>The value of the 1Voucher being refunded.</b> The currency is "ZAR" and the value is in cents.
storeId	String	No	<b>Alphanumeric characters</b> allowed	<b>The store where the 1Voucher was refunded.</b> For Merchants with <b>Digital</b> channels, this will be a single value. For Merchants with <b>Physical</b> Store locations, each individual storeId will need to be sent in the request.
terminalId	String	No	<b>Alphanumeric characters</b> allowed	<b>The till in the store where the 1Voucher was refunded.</b> For Merchants with <b>Digital</b> channels, this will be a single value. For Merchants with <b>Physical</b> store locations, each individual terminalId will need to be sent in the request.
mobileNumber	String	No	<b>11 Digits</b> (27 Country Code with no leading 0)	For a <b>Refund</b> , the new Voucher will be sent as an SMS to the mobileNumber provided. If no mobileNumber is supplied, the Voucher will be returned in the response.
metadata	Set of Key Value Pairs	No	<b>Up to 9 properties.</b> Property name up to 10 characters. Property value up to 43 characters	<b>Set of key-value pairs.</b> This can be useful for storing additional information about the transaction in a structured format. e.g. key-value pair: storeID and value could be used to identify Voucher redemptions at a store level.

### 2.3.4.2 Example Request and Response

For a request and response example, please refer to the [Refund a 1Voucher Redemption](#) request and response.

### 2.3.5 Reverse a 1Voucher Transaction

Note: SMS is not supported for change voucher and refund transactions when a Merchant has been configured for Reversals. 1Vouchers that have been purchased and redeemed cannot be reversed.

HTTP Method	Endpoint
POST	<a href="#">Base URL</a> /aggregation/4.0/1voucher/reverse

Parameter	Data Type	Required	Format	Description
reference	String	Yes	Only -.,= and alphanumeric characters allowed	<b>Client-defined reference number</b> Must be unique for all transactions.
originalReference	String	Yes	Only -.,= and alphanumeric characters allowed	<b>Client-defined reference number</b> of the original transaction that is being reversed.
accountNumber	String	Yes	Alphanumeric characters allowed	The <b>account number</b> of the Merchant.

### 2.3.5.1 Example Request and Response

For a request and response example, please refer to the [Reverse a 1Voucher Transaction](#) request and response

## 2.4 Gift Vouchers

The Gift Vouchers product group provides the ability to purchase Gift Voucher products. The following endpoints are available for Gift Vouchers:

### 2.4.1 Purchase a Gift Voucher

HTTP Method	Endpoint
POST	<a href="#">Base URL</a> /aggregation/4.0/gift-voucher/purchase

#### 2.4.1.1 Request Parameters

Parameter	Data Type	Required	Format	Description
reference	String	Yes	Only -.,= and <b>alphanumeric characters</b> allowed	<b>Client-defined reference number</b> Must be unique for all transactions.
accountNumber	String	Yes	<b>Alphanumeric characters</b> allowed	The <b>account number</b> of the Merchant.
amount	Integer	Yes	<b>Cents</b>	<b>The value of the Gift Voucher being purchased.</b> The currency is "ZAR" and the value is in cents.
productCode	Integer	Yes	<b>Positive Integers</b> allowed.	A <b>Flash assigned unique product identifier</b> that identifies a specific Gift Voucher product being purchased.
storeId	String	Yes	<b>Alphanumeric characters</b> allowed	<b>The store where the Gift Voucher was purchased.</b> For Merchants with <b>Digital</b> channels, this will be a single value. For Merchants with <b>Physical</b> Store locations, each individual storeId will need to be sent in the request.
terminalId	String	Yes	<b>Alphanumeric characters</b> allowed	<b>The till in the store where the Gift Voucher was purchased.</b> For Merchants with <b>Digital</b> channels, this will be a single value. For Merchants with <b>Physical</b> store locations, each individual terminalId will need to be sent in the request.
barcode	String	No	<b>Positive Integers</b> allowed.	A <b>Flash assigned EAN</b> that identifies a specific Gift Voucher product being purchased. A barcode can be provided in place of the product code. If a barcode is provided, the product code cannot be included and an error will be returned.

<b>paymentMethod</b>	String	No	Alphanumeric characters allowed	The paymentMethod used to make the GiftVoucher purchase.
<b>metadata</b>	Set of Key Value Pairs	No	Up to 9 properties. Property name up to 10 characters. Property value up to 43 characters	Set of key-value pairs. This can be useful for storing additional information about the transaction in a structured format. e.g. key-value pair: storeID and value could be used to identify Voucher redemptions at a store level.

#### 2.4.1.2 Example Request and Response

For a request and response example, please refer to the [Purchase a Gift Voucher](#) request and response.

## 2.5 Cash Out PIN

The Cash Out PIN product group provides the ability to access Cash Out PIN services, this includes purchasing and cancelling the purchase of a Cash Out PIN. The following endpoints are available for Cash Out PIN:

### 2.5.1 Purchase a Cash Out PIN

HTTP Method	Endpoint
POST	<a href="#">Base URL</a> /aggregation/4.0/cash-out-pin/purchase

#### 2.5.1.1 Request Parameters

Parameter	Data Type	Required	Format	Description
<b>reference</b>	String	Yes	Only -.,= and alphanumeric characters allowed	Client-defined reference number Must be unique for all transactions.
<b>accountNumber</b>	String	Yes	Alphanumeric characters allowed	The account number of the Merchant.
<b>amount</b>	Integer	Yes	Cents	The value of the Cash Out PIN being purchased. The currency is "ZAR" and the value is in cents.
<b>productCode</b>	Integer	Yes	Positive Integers allowed.	A Flash assigned unique product identifier that identifies the Cash Out PIN product assigned to a Merchant account.
<b>storeId</b>	String	No	Alphanumeric characters allowed	The store where the Cash Out PIN was purchased. For Merchants with Digital channels, this will be a single value. For Merchants with Physical Store locations, each individual storeId will need to be sent in the request.
<b>terminalId</b>	String	No	Alphanumeric characters allowed	The till in the store where the Cash Out PIN was purchased. For Merchants with Digital channels, this will be a single value. For Merchants with Physical store locations, each individual terminalId will need to be sent in the request.
<b>paymentMethod</b>	String	No	Alphanumeric characters allowed	The paymentMethod used to make the Cash Out PIN purchase.

<b>metadata</b>	Set of Key Value Pairs	No	<b>Up to 9 properties.</b> Property name up to 10 characters. Property value up to 43 characters	<b>Set of key-value pairs.</b> This can be useful for storing additional information about the transaction in a structured format. e.g. key-value pair: storeID and value could be used to identify Voucher redemptions at a store level.
-----------------	------------------------	----	--	---

### 2.5.1.2 Example Request and Response

For a request and response example, please refer to the [Purchase a Cash Out PIN request and response](#).

### 2.5.2 Cancel a Cash Out PIN Purchase

HTTP Method	Endpoint
POST	<a href="#">Base URL</a> /aggregation/4.0/cash-out-pin/cancel

#### 2.5.2.1 Request Parameters

Parameter	Data Type	Required	Format	Description
<b>reference</b>	String	Yes	Only -.,= and <b>alphanumeric characters</b> allowed	<b>Client-defined reference number</b> Must be unique for all transactions.
<b>accountNumber</b>	String	Yes	<b>Alphanumeric characters</b> allowed	The <b>account number</b> of the Merchant.
<b>serialNumber</b>	String	Yes	<b>Alphanumeric characters</b> allowed	<b>The serial number</b> issued for the Cash out PIN. This is used to identify the Voucher being cancelled.
<b>productCode</b>	Integer	Yes	<b>Positive Integers</b> allowed.	A Flash assigned unique product identifier that identifies the Cash Out PIN product assigned to a Merchant account.
<b>storeId</b>	String	No	<b>Alphanumeric characters</b> allowed	<b>The store where the Cash Out PIN was cancelled.</b> For Merchants with <b>Digital</b> channels, this will be a single value. For Merchants with <b>Physical</b> Store locations, each individual storeId will need to be sent in the request.
<b>terminalId</b>	String	No	<b>Alphanumeric characters</b> allowed	<b>The till in the store where the Cash Out PIN was cancelled.</b> For Merchants with <b>Digital</b> channels, this will be a single value. For Merchants with <b>Physical</b> store locations, each individual terminalId will need to be sent in the request.
<b>metadata</b>	Set of Key Value Pairs	No	<b>Up to 9 properties.</b> Property name up to 10 characters. Property value up to 43 characters	<b>Set of key-value pairs.</b> This can be useful for storing additional information about the transaction in a structured format. e.g. key-value pair: storeID and value could be used to identify Voucher redemptions at a store level.

#### 2.5.2.2 Example Request and Response

For a request and response example, please refer to the [Cancel a Cash Out PIN Purchase](#) request and response.

### 2.5.3 Look up a Cash Out PIN

HTTP Method	Endpoint
POST	<a href="#">Base URL</a> /aggregation/4.0/cash-out-pin/lookup

#### 2.5.3.1 Request Parameters

Parameter	Data Type	Required	Format	Description
reference	String	Yes	Only <code>-.,=</code> and <b>alphanumeric characters</b> allowed	<b>Client-defined reference number</b> Must be unique for all transactions.
accountNumber	String	Yes	<b>Alphanumeric characters</b> allowed	The <b>account number</b> of the Merchant.
serialNumber	String	Yes	<b>Alphanumeric characters</b> allowed	<b>The serial number</b> issued for the Cash out PIN. This is used to identify the Voucher being looked up.
productCode	Integer	Yes	<b>Positive Integers</b> allowed.	A <b>Flash assigned unique product identifier</b> that identifies the Cash Out PIN product assigned to a Merchant account.
metadata	Set of Key Value Pairs	No	<b>Up to 9 properties.</b> Property name up to 10 characters. Property value up to 43 characters.	<b>Set of key-value pairs.</b> This can be useful for storing additional information about the transaction in a structured format. e.g. key-value pair: storeID and value could be used to identify Voucher redemptions at a store level.

#### 2.5.3.2 Example Request and Response

For a request and response example, please refer to the [Look up a Cash Out PIN](#) request and response.

### 2.5.4 Reverse a Cash Out PIN Transaction

Note: Cash Out PINs that have been purchased and redeemed cannot be reversed.

HTTP Method	Endpoint
POST	<a href="#">Base URL</a> /aggregation/4.0/cash-out-pin/reverse

Parameter	Data Type	Required	Format	Description

<b>reference</b>	String	Yes	Only -.,= and alphanumeric characters allowed	<b>Client-defined reference number</b> Must be unique for all transactions.
<b>originalReference</b>	String	Yes	Only -.,= and alphanumeric characters allowed	<b>Client-defined reference number</b> of the original transaction that is being reversed.
<b>accountNumber</b>	String	Yes	Alphanumeric characters allowed	The <b>account number</b> of the Merchant.

#### 2.5.4.1 Example Request and Response

For a request and response example, please refer to the [Reverse a Cash Out PIN](#) request and response.

### 2.6 Flash Token

#### 2.6.1 Purchase a Flash Token

HTTP Method	Endpoint
<b>POST</b>	<a href="#">Base URL</a> /aggregation/flash-token/purchase

Parameter	Data Type	Required	Format	Description
<b>reference</b>	String	Yes	Only -.,= and alphanumeric characters allowed	<b>Client-defined reference number</b> Must be unique for all transactions.
<b>accountNumber</b>	String	Yes	Alphanumeric characters allowed	The <b>account number</b> of the Merchant.
<b>amount</b>	Integer	Yes	Cents	<b>The value of the Flash Token being purchased.</b> The currency is "ZAR" and the value is in cents.
<b>storeId</b>	String	No	Alphanumeric characters allowed	<b>The store where the Flash Token was purchased.</b> For Merchants with <b>Digital</b> channels, this will be a single value. For Merchants with <b>Physical</b> Store locations, each individual storeId will need to be sent in the request.
<b>terminalId</b>	String	No	Alphanumeric characters allowed	<b>The till in the store where the Flash Token was purchased.</b> For Merchants with <b>Digital</b> channels, this will be a single value. For Merchants with <b>Physical</b> store locations, each individual terminalId will need to be sent in the request.
<b>paymentMethod</b>	String	No	Alphanumeric characters allowed	<b>The paymentMethod used to make the Flash Token purchase.</b>
<b>metadata</b>	Set of Key Value Pairs	No	Up to 9 properties. Property name up to 10 characters. Property value up to 43 characters	<b>Set of key-value pairs.</b> This can be useful for storing additional information about the transaction in a structured format. e.g. key-value pair: storeID and value could be used to identify Voucher redemptions at a store level.

#### 2.6.1.1 Example Request and Response

For a request and response example, please refer to the [Purchase a 1Voucher](#) request and response.

## 2.6.2 Reverse a Flash Token Transaction

Note: Flash Tokens that have been purchased and redeemed cannot be reversed.

HTTP Method	Endpoint
POST	<a href="#">Base URL</a> /aggregation/4.0/flash-token/reverse

Parameter	Data Type	Required	Format	Description
reference	String	Yes	Only -.,= and alphanumeric characters allowed	<b>Client-defined reference number</b> Must be unique for all transactions.
originalReference	String	Yes	Only -.,= and alphanumeric characters allowed	<b>Client-defined reference number</b> of the original transaction that is being reversed.
accountNumber	String	Yes	Alphanumeric characters allowed	The <b>account number</b> of the Merchant.

### 2.6.2.1 Example Request and Response

For a request and response example, please refer to the [Reverse a 1Voucher Transaction](#) request and response

## 2.7 Cellular

The Cellular product group provides the ability to access Cellular services. This currently includes purchasing of Pinless Recharges. The following endpoints are available for Cellular:

### 2.7.1 Purchase a Cellular Pinless Recharge

HTTP Method	Endpoint
POST	<a href="#">Base URL</a> /aggregation/4.0/cellular/pinless/purchase

#### 2.7.1.1 Request Parameters

Parameter	Data Type	Required	Format	Description
reference	String	Yes	Only -.,= and <b>alphanumeric characters</b> allowed	<b>Client-defined reference number</b> Must be unique for all transactions.
accountNumber	String	Yes	<b>Alphanumeric characters</b> allowed	The <b>account number</b> of the Merchant.
amount	Integer	Yes	Cents	<b>The value of the Cellular Pinless Recharge being purchased.</b> The currency is "ZAR" and the value is in cents.
productCode	Integer	Yes	<b>Positive Integers</b> allowed.	A <b>Flash assigned unique product identifier</b> that identifies a specific Cellular product being purchased.
storeId	String	No	<b>Alphanumeric characters</b> allowed	<b>The store where the Cellular Pinless Recharge was purchased.</b> For Merchants with <b>Digital</b> channels, this will be a single value. For Merchants with <b>Physical</b> Store locations, each individual storeId will need to be sent in the request.
terminalId	String	No	<b>Alphanumeric characters</b> allowed	<b>The till in the store where the Cellular Pinless Recharge was purchased.</b> For Merchants with <b>Digital</b> channels, this will be a single value. For Merchants with <b>Physical</b> store locations, each individual terminalId will need to be sent in the request.
mobileNumber	String	Yes	<b>11 Digits</b> (27 Country Code with no leading 0)	The <b>mobile number</b> that the recharge is being requested for.
paymentMethod	String	No	<b>Alphanumeric characters</b> allowed	<b>The paymentMethod used to make the Cellular Pinless Recharge Purchase.</b>
metadata	Set of Key Value Pairs	No	<b>Up to 9 properties.</b> Property name up to 10 characters. Property value up to 43 characters	<b>Set of key-value pairs.</b> This can be useful for storing additional information about the transaction in a structured format. e.g. key-value pair: storeID and value could be used to identify Voucher redemptions at a store level.

### 2.7.1.2 Example Request and Response

For a request and response example, please refer to the [Purchase a Cellular Pinless Recharge](#) request and response.

## 2.8 Eezi Vouchers

The Eezi Voucher product group provides the ability to access Eezi Voucher services. This currently only includes purchasing of Eezi Airtime. The following endpoints are available for Eezi Voucher:

### 2.8.1 Purchase an Eezi Voucher

HTTP Method	Endpoint
POST	<a href="#">Base URL</a> /aggregation/4.0/eezi-voucher/purchase

#### 2.8.1.1 Request Parameters

Parameter	Data Type	Required	Format	Description
reference	String	Yes	Only -.,= and alphanumeric characters allowed	<b>Client-defined reference number</b> Must be unique for all transactions.
accountNumber	String	Yes	Alphanumeric characters allowed	The account number of the Merchant.
amount	Integer	Yes	Cents	The value of the Eezi Voucher being purchased. The currency is "ZAR" and the value is in cents.
productCode	Integer	Yes	Positive Integers allowed.	A Flash assigned unique product identifier that identifies a specific Eezi Voucher product being purchased.
storeId	String	No	Alphanumeric characters allowed	The store where the Eezi Voucher was purchased. For Merchants with Digital channels, this will be a single value. For Merchants with Physical Store locations, each individual storeID will need to be sent in the request.
terminalId	String	No	Alphanumeric characters allowed	The till in the store where the Eezi Voucher was purchased. For Merchants with Digital channels, this will be a single value. For Merchants with Physical store locations, each individual terminalID will need to be sent in the request.
paymentMethod	String	No	Alphanumeric characters allowed	The paymentMethod used to make the Eezi Voucher purchase.
metadata	Set of Key Value Pairs	No	Up to 9 properties. Property name up to 10 characters. Property value up to 43 characters	Set of key-value pairs. This can be useful for storing additional information about the transaction in a structured format. e.g. key-value pair: storeID and value could be used to identify Voucher redemptions at a store level.

#### 2.8.1.2 Example Request and Response

For a request and response example, please refer to the [Purchase an Eezi Voucher](#) request and response.

## 2.8.2 Reverse an Eezi Voucher Transaction

Note: Eezi Vouchers that have been purchased and redeemed cannot be reversed.

HTTP Method	Endpoint
POST	<a href="#">Base URL</a> /aggregation/4.0/eezi-voucher/reverse

Parameter	Data Type	Required	Format	Description
reference	String	Yes	Only -.,= and alphanumeric characters allowed	<b>Client-defined reference number</b> Must be unique for all transactions.
originalReference	String	Yes	Only -.,= and alphanumeric characters allowed	<b>Client-defined reference number</b> of the original transaction that is being reversed.
accountNumber	String	Yes	Alphanumeric characters allowed	The <b>account number</b> of the Merchant.

### 2.8.2.1 Example Request and Response

For a request and response example, please refer to the [Reverse an Eezi Voucher Transaction](#) request and response.

## 2.9 Prepaid Utilities

The Prepaid Utilities product group provides the ability to access Prepaid Utility services. This currently includes purchasing of Water & Electricity vouchers.

### 2.9.1 Look up a Meter Number

HTTP Method	Endpoint
POST	<a href="#">Base URL</a> /aggregation/4.0/prepaid-utilities/lookup

#### 2.9.1.1 Request Parameters

Parameter	Data Type	Required	Format	Description
reference	String	Yes	Only -.,= and alphanumeric characters allowed	<b>Client-defined reference number</b> Must be unique for all transactions.
accountNumber	String	Yes	Alphanumeric characters allowed	The <b>account number</b> of the Merchant.
amount	Integer	Yes	Cents	The <b>value of the Prepaid Utility voucher being purchased</b> . The currency is "ZAR" and the value is in cents.
meterNumber	String	Yes	Alphanumeric characters allowed	The <b>meter number</b> that the purchase is being requested for.
isFBE	Boolean	No	true or false	Identifies if the purchase request is for <b>Free Basic Electricity</b> . The default value is <b>false</b> if this parameter is not sent in the request.
metadata	Set of Key Value Pairs	No	Up to 9 properties. Property name up to 10 characters. Property value up to 43 characters	<b>Set of key-value pairs</b> . This can be useful for storing additional information about the transaction in a structured format. e.g. key-value pair: storeID and value could be used to identify Voucher redemptions at a store level.

#### 2.9.1.2 Example Request and Response

For a request and response example, please refer to the [Look up a Meter Number](#) request and response.

## 2.9.2 Purchase a Prepaid Utility Voucher

HTTP Method	Endpoint
POST	<a href="#">Base URL</a> /aggregation/4.0/prepaid-utilities/purchase

### 2.9.2.1 Request Parameters

Parameter	Data Type	Required	Format	Description
reference	String	Yes	Only -.,= and <b>alphanumeric characters</b> allowed	<b>Client-defined reference number</b> Must be unique for all transactions.
accountNumber	String	Yes	<b>Alphanumeric characters</b> allowed	The <b>account number</b> of the Merchant.
amount	Integer	Yes	<b>Cents</b>	<b>The value of the Prepaid Utility voucher being purchased.</b> The currency is "ZAR" and the value is in cents.
meterNumber	String	Yes	<b>Alphanumeric characters</b> allowed	The <b>meter number</b> that the purchase is being requested for.
storeId	String	No	<b>Alphanumeric characters</b> allowed	<b>The store where the Prepaid Utility Voucher was purchased.</b> For Merchants with <b>Digital</b> channels, this will be a single value. For Merchants with <b>Physical</b> Store locations, each individual storeID will need to be sent in the request.
terminalId	String	No	<b>Alphanumeric characters</b> allowed	<b>The till in the store where the Prepaid Utility Voucher was purchased.</b> For Merchants with <b>Digital</b> channels, this will be a single value. For Merchants with <b>Physical</b> store locations, each individual terminalId will need to be sent in the request.
paymentMethod	String	No	<b>Alphanumeric characters</b> allowed	<b>The paymentMethod used to make the Prepaid Utility Voucher purchase.</b>
isFBE	Boolean	No	<b>true or false</b>	Identifies if the purchase request is for <b>Free Basic Electricity</b> . The default value is <b>false</b> if this parameter is not sent in the request.
metadata	Set of Key Value Pairs	No	<b>Up to 9 properties.</b> Property name up to 10 characters. Property value up to 43 characters	<b>Set of key-value pairs.</b> This can be useful for storing additional information about the transaction in a structured format. e.g. key-value pair: storeID and value could be used to identify Voucher redemptions at a store level.

### 2.9.2.2 Example Request and Response

For a request and response example, please refer to the [Purchase a Prepaid Utility Voucher](#) request and response.

## 2.10 Flash Pay

The Flash Pay product group provides the ability to query the balance, disburse to, or pay customer accounts at Flash Pay billers. The following endpoints are available for Flash Pay.

PLEASE NOTE: The Flash Pay endpoints are designed to work in the following order:

1. Call /flash-pay/balance endpoint to confirm if customer account details are correct
2. Call /flash-pay/disburse OR /flash-pay/purchase endpoint to load funds into on to the relevant biller account

### 2.10.1 Lookup a Flash Pay Biller Account

HTTP Method	Endpoint
POST	<a href="#">Base URL</a> /aggregation/4.0/flash-pay/balance

#### 2.10.1.1 Request Parameters

Parameter	Data Type	Required	Format	Description
reference	String	Yes	Only -.,= and alphanumeric characters allowed	<b>Client-defined reference number</b> Must be unique for all transactions.
accountNumber	String	Yes	Alphanumeric characters allowed	The <b>account number</b> of the Merchant.
accountReference	String	Yes	Alphanumeric characters allowed	The <b>account reference</b> of the customer being looked up at the Flash Pay Biller. This is to be prefixed with the provided <a href="#">billier codes</a>
storeId	String	No	Alphanumeric characters allowed	<b>The store where the Prepaid Utility Voucher was purchased.</b> For Merchants with <b>Digital</b> channels, this will be a single value. For Merchants with <b>Physical</b> Store locations, each individual storeID will need to be sent in the request.
terminalId	String	No	Alphanumeric characters allowed	<b>The till in the store where the Prepaid Utility Voucher was purchased.</b> For Merchants with <b>Digital</b> channels, this will be a single value. For Merchants with <b>Physical</b> store locations, each individual terminalId will need to be sent in the request.
metadata	Set of Key Value Pairs	No	Up to 9 properties. Property name up to 10 characters. Property value up to 43 characters	<b>Set of key-value pairs.</b> This can be useful for storing additional information about the transaction in a structured format. e.g. key-value pair: storeID and value could be used to identify Voucher redemptions at a store level.

### 2.10.1.2 Example Request and Response

For a request and response example, please refer to the [Lookup a Flash Pay Biller Account Balance](#) request and response.

### 2.10.2 Pay a Flash Pay Biller Account

Note: this request will only be available for paying a Flash Pay Biller Account using payment methods.

HTTP Method	Endpoint
POST	<a href="#">Base URL</a> /aggregation/4.0/flash-pay/purchase

#### 2.10.2.1 Request Parameters

Parameter	Data Type	Required	Format	Description
reference	String	Yes	Only -.,= and <b>alphanumeric characters</b> allowed	<b>Client-defined reference number</b> Must be unique for all transactions.
accountNumber	String	Yes	<b>Alphanumeric characters</b> allowed	The <b>account number</b> of the Merchant.
accountReference	String	Yes	<b>Alphanumeric characters</b> allowed	The <b>account reference</b> of the customer being paid to at the Flash Pay Biller. This is to be prefixed with the provided <a href="#">billercodes</a>
amount	Integer	Yes	<b>Cents</b>	<b>The amount being paid to the Flash Pay Biller.</b> The currency is "ZAR" and the value is in cents.
paymentMethod	String	No	<b>Alphanumeric characters</b> allowed	<b>The paymentMethod used to make the Flash Pay Biller Account Payment.</b> The Payment Methods can either be "Cash" or "Credit Card"
terminalID	String	No	<b>true or false</b>	<b>The till in the store where the Flash Pay Biller Account was paid.</b> For Merchants with <b>Digital</b> channels, this will be a single value. For Merchants with <b>Physical</b> store locations, each individual terminalID will need to be sent in the request.
storeId	String	No	<b>true or false</b>	<b>The store where the Flash Pay Biller Account was paid.</b> For Merchants with <b>Digital</b> channels, this will be a single value. For Merchants with <b>Physical</b> Store locations, each individual storeID will need to be sent in the request.
metadata	Set of Key Value Pairs	No	<b>Up to 9 properties.</b> Property name up to 10 characters. Property value up to 43 characters	<b>Set of key-value pairs.</b> This can be useful for storing additional information about the transaction in a structured format. e.g. key-value pair: storeID and value could be used to identify Voucher redemptions at a store level.

### 2.10.2.2 Example Request and Response

For a request and response example, please refer to the [Pay a Flash Pay Biller Account](#) request and response.

### 2.10.3 Disburse into a Flash Pay Biller Account

Note: this request will only be available for disbursing into Flash Pay Biller Accounts from an online balance.

HTTP Method	Endpoint
POST	<a href="#">Base URL</a> /aggregation/4.0/flash-pay/disburse

#### 2.10.3.1 Request Parameters

Parameter	Data Type	Required	Format	Description
reference	String	Yes	Only -.,= and alphanumeric characters allowed	<b>Client-defined reference number</b> Must be unique for all transactions.
accountNumber	String	Yes	Alphanumeric characters allowed	The <b>account number</b> of the Merchant.
accountReference	String	Yes	Alphanumeric characters allowed	The <b>account reference</b> of the customer being disbursed to at the Flash Pay Biller. This is to be prefixed with the provided <a href="#">billercodes</a>
amount	Integer	Yes	Cents	<b>The amount being disbursed to the Flash Pay Biller.</b> The currency is "ZAR" and the value is in cents.
metadata	Set of Key Value Pairs	No	Up to 9 properties. Property name up to 10 characters. Property value up to 43 characters	<b>Set of key-value pairs.</b> This can be useful for storing additional information about the transaction in a structured format. e.g. key-value pair: storeID and value could be used to identify Voucher redemptions at a store level.

#### 2.10.3.2 Example Request and Response

For a request and response example, please refer to the [Disburse into a Flash Pay Biller Account](#) request and response.

## 3 Example Requests and Responses

### 3.1.1 List Products

Request Example	Response Example
{}	{         "responseCode": 0,         "responseMessage": "string",         "products": [             {                 "productCode": 0,                 "productName": "string",                 "minimumAmount": 0,                 "maximumAmount": 0,                 "status": "string",                 "supplierName": "string",                 "vendor": "string",                 "productGroup": "string",                 "barcode": "string",                 "billierCode": "string",                 "productType": 0,                 "allowReversal": true,                 "fixedAmount": true,                 "content": {                     "redemptionInstructions": "string",                     "termsAndConditions": "string"                 }             }         ]     }

### 3.1.2 Lookup a Product by Product Code

Request Example	Response Example
{}	{         "responseCode": 0,         "responseMessage": "string",         "products": [             {                 "productCode": 0,                 "productName": "string",                 "minimumAmount": 0,                 "maximumAmount": 0,                 "status": "string",                 "supplierName": "string",                 "vendor": "string",                 "productGroup": "string",                 "barcode": "string",                 "billierCode": "string",                 "productType": 0,                 "allowReversal": true,                 "fixedAmount": true,                 "content": {                     "redemptionInstructions": "string",                     "termsAndConditions": "string"                 }             }         ]     }

	<pre>     "status": "string",     "supplierName": "string",     "vendor": "string",     "productGroup": "string",     "barcode": "string",     "billerCode": "string",     "productType": 0,     "allowReversal": true,     "fixedAmount": true,     "content": {       "redemptionInstructions": "string",       "termsAndConditions": "string"     }   } ]</pre>
--	--

### 3.1.3 Lookup Products by Product Group

Request Example	Response Example
{}	<pre>{   "responseCode": 0,   "responseMessage": "string",   "products": [     {       "productCode": 0,       "productName": "string",       "minimumAmount": 0,       "maximumAmount": 0,       "status": "string",       "supplierName": "string",       "vendor": "string",       "productGroup": "string",       "barcode": "string",       "billerCode": "string",       "productType": 0,       "allowReversal": true,       "fixedAmount": true,       "content": {         "redemptionInstructions": "string",         "termsAndConditions": "string"       }     }   ] }</pre>

### 3.1.4 Purchase a Voucher

Request Example	Response Example
<pre>{   "reference": "string",   "accountNumber": "string",   "amount": 0,   "storeId": "string",   "terminalId": "string",   "paymentMethod": "string",   "metadata": {     "additionalProp1": "string",     "additionalProp2": "string",     "additionalProp3": "string"   }, }</pre>	<pre>{   "responseCode": 0,   "responseMessage": "string",   "accountNumber": "string",   "reference": "string",   "transactionDate": "string",   "transactionId": 0,   "metadata": {     "additionalProp1": "string",     "additionalProp2": "string",     "additionalProp3": "string"   },   "storeId": "string",   "terminalId": "string",   "amount": 0, }</pre>

```

"voucher": {
    "amount": 0,
    "expiryDate": "string",
    "pin": "string",
    "serialNumber": "string",
    "status": "string",
    "content": {
        "redemptionInstructions": "string",
        "termsAndConditions": "string"
    }
}
}

```

### 3.1.5 Disburse a 1Voucher

Request Example	Response Example
<pre>{     "reference": "string",     "accountNumber": "string",     "amount": 0,     "storeId": "string",     "terminalId": "string",     "metadata": {         "additionalProp1": "string",         "additionalProp2": "string",         "additionalProp3": "string"     }, } }</pre>	<pre>{     "responseCode": 0,     "responseMessage": "string",     "accountNumber": "string",     "reference": "string",     "transactionDate": "string",     "transactionId": 0,     "metadata": {         "additionalProp1": "string",         "additionalProp2": "string",         "additionalProp3": "string"     },     "storeId": "string",     "terminalId": "string",     "amount": 0,     "voucher": {         "amount": 0,         "expiryDate": "string",         "pin": "string",         "serialNumber": "string",         "status": "string",         "content": {             "redemptionInstructions": "string",             "termsAndConditions": "string"         }     } }</pre>

### 3.1.6 Redeem a 1Voucher

Request Example	Response Example
<pre>{     "reference": "string",     "accountNumber": "string",     "amount": 0,     "mobileNumber": "string",     "storeId": "string",     "terminalId": "string",     "pin": "string",     "metadata": {         "additionalProp1": "string",         "additionalProp2": "string",         "additionalProp3": "string"     }, } }</pre>	<pre>{     "responseCode": 0,     "responseMessage": "string",     "accountNumber": "string",     "reference": "string",     "transactionDate": "string",     "transactionId": 0,     "metadata": {         "additionalProp1": "string",         "additionalProp2": "string",         "additionalProp3": "string"     },     "storeId": "string", }</pre>

}	<pre> "terminalId": "string", "amount": 0, "voucher": {   "amount": 0,   "expiryDate": "string",   "pin": "string",   "serialNumber": "string",   "status": "string",   "content": {     "redemptionInstructions": "string",     "termsAndConditions": "string"   } } } </pre>
---	--

### 3.1.7 Refund a 1Voucher Redemption

Request Example	Response Example
<pre> {   "reference": "string",   "accountNumber": "string",   "amount": 0,   "mobileNumber": "string",   "storeId": "string",   "terminalId": "string",   "metadata": {     "additionalProp1": "string",     "additionalProp2": "string",     "additionalProp3": "string"   } } </pre>	<pre> {   "responseCode": 0,   "responseMessage": "string",   "accountNumber": "string",   "reference": "string",   "transactionDate": "string",   "transactionId": 0,   "metadata": {     "additionalProp1": "string",     "additionalProp2": "string",     "additionalProp3": "string"   },   "storeId": "string",   "terminalId": "string",   "amount": 0,   "voucher": {     "amount": 0,     "expiryDate": "string",     "pin": "string",     "serialNumber": "string",     "status": "string",     "content": {       "redemptionInstructions": "string",       "termsAndConditions": "string"     }   } } </pre>

### 3.1.8 Reverse a 1Voucher Transaction

Request Example	Response Example
<pre> {   "reference": "string",   "originalReference": "string",   "accountNumber": "string",   "metadata": {     "additionalProp1": "string",     "additionalProp2": "string",     "additionalProp3": "string"   } } </pre>	<pre> {   "responseCode": 0,   "responseMessage": "string",   "accountNumber": "string",   "reference": "string",   "transactionDate": "string",   "transactionId": 0,   "metadata": {     "additionalProp1": "string",     "additionalProp2": "string",     "additionalProp3": "string"   },   "storeId": "string",   "terminalId": "string", </pre>

	<pre>"mobileNumber": "string", "amount": 0, "voucher": {   "amount": 0,   "expiryDate": "string",   "redemptionDate": "string",   "pin": "string",   "serialNumber": "string",   "status": "string",   "content": {     "redemptionInstructions": "string",     "termsAndConditions": "string"   } } }</pre>
--	--

### 3.1.9 Purchase a Flash Token

Request Example	Response Example
<pre>{   "reference": "string",   "accountNumber": "string",   "amount": 0,   "productCode": "0",   "storeId": "string",   "terminalId": "string",   "paymentMethod": "string",   "metadata": {     "additionalProp1": "string",     "additionalProp2": "string",     "additionalProp3": "string"   } }</pre>	<pre>{   "responseCode": 0,   "responseMessage": "string",   "accountNumber": "string",   "reference": "string",   "transactionDate": "string",   "transactionId": 0,   "metadata": {     "additionalProp1": "string",     "additionalProp2": "string",     "additionalProp3": "string"   },   "storeId": "string",   "terminalId": "string",   "amount": 0,   "voucher": {     "amount": 0,     "expiryDate": "string",     "pin": "string",     "serialNumber": "string",     "status": "string",     "content": {       "redemptionInstructions": "string",       "termsAndConditions": "string"     }   } }</pre>

### 3.1.10 Reverse a Flash Token Transaction

Request Example	Response Example
<pre>{   "reference": "string",   "accountNumber": "string",   "amount": 0,   "productCode": "0",   "storeId": "string",   "terminalId": "string",   "paymentMethod": "string",   "metadata": {     "additionalProp1": "string",     "additionalProp2": "string",     "additionalProp3": "string"   } }</pre>	<pre>{   "responseCode": 0,   "responseMessage": "string",   "accountNumber": "string",   "reference": "string",   "transactionDate": "string",   "transactionId": 0,   "metadata": {     "additionalProp1": "string",     "additionalProp2": "string",     "additionalProp3": "string"   },   "storeId": "string",   "</pre>

}	<pre> "terminalId": "string", "amount": 0, "voucher": {   "amount": 0,   "expiryDate": "string",   "pin": "string",   "serialNumber": "string",   "status": "string",   "content": {     "redemptionInstructions": "string",     "termsAndConditions": "string"   } } } </pre>
---	--

### 3.1.11 Purchase a Gift Voucher

Request Example	Response Example
<pre> {   "reference": "string",   "accountNumber": "string",   "amount": 0,   "storeId": "string",   "terminalId": "string",   "barcode": "string",   "paymentMethod": "string",   "metadata": {     "additionalProp1": "string",     "additionalProp2": "string",     "additionalProp3": "string"   }, } </pre>	<pre> {   "responseCode": 0,   "responseMessage": "string",   "accountNumber": "string",   "reference": "string",   "transactionDate": "string",   "transactionId": 0,   "metadata": {     "additionalProp1": "string",     "additionalProp2": "string",     "additionalProp3": "string"   },   "storeId": "string",   "terminalId": "string",   "amount": 0,   "voucher": {     "amount": 0,     "expiryDate": "string",     "pin": "string",     "serialNumber": "string",     "barcode": "string",     "status": "string",     "content": {       "redemptionInstructions": "string",       "termsAndConditions": "string"     }   } } </pre>

### 3.1.12 Purchase a Cash Out PIN

Request Example	Response Example
<pre> {   "reference": "string",   "accountNumber": "string",   "amount": 0,   "productCode": "0",   "storeId": "string",   "terminalId": "string",   "paymentMethod": "string",   "metadata": {     "additionalProp1": "string",     "additionalProp2": "string",     "additionalProp3": "string"   } } </pre>	<pre> {   "responseCode": 0,   "responseMessage": "string",   "accountNumber": "string",   "reference": "string",   "transactionDate": "string",   "transactionId": 0,   "metadata": {     "additionalProp1": "string",     "additionalProp2": "string",     "additionalProp3": "string"   },   "storeId": "string", </pre>

}	<pre> "terminalId": "string", "amount": 0, "voucher": {   "amount": 0,   "expiryDate": "string",   "pin": "string",   "serialNumber": "string",   "status": "string",   "content": {     "redemptionInstructions": "string",     "termsAndConditions": "string"   } } } </pre>
